

# Automatic Pill Dispenser

Category: Assistive Technology | Status: Completed Prototype | 7 min read

A timer-based Arduino dispenser concept that uses a real-time clock, servo motor, display, buzzer, and LEDs to support medication reminders.

## ***Materials***

- Arduino UNO R3
- Pill organizer or compartment wheel
- Servo motor
- Real-time clock module
- LCD display
- Buzzer
- LEDs
- Jumper wires

## ***What I learned***

- Assistive technology needs reliability, not just a working demo.
- A clear alert system matters because users need to understand what the device is doing.
- Physical design and software logic have to work together.

## ***Safety or accuracy note***

This prototype is for learning and demonstration only. It is not a medical device and should not be used for diagnosis or treatment.
